

# Yellow Vests, Carbon Tax Aversion, and Biased Beliefs

Thomas Douenne & **Adrien Fabre**

*Paris School of Economics, Université Paris 1*

February 2020

## Are French people ecologist?

Figure: Some Yellow Vests

What happened to the French “carbon tax”?

- 1 Tax on fossil fuels created in 2014, should have increased progressively until 100€/tCO<sub>2</sub> in 2022
- 2 Yellow Vests protested against rising fuel prices, for more purchasing power and more democracy
- 3 The government froze the tax at 50€/tCO<sub>2</sub>

How to avoid regressivity of carbon tax?

→ **Tax & Dividend**: redistributing equally the revenues. Makes it:

- progressive (e.g. *West & Williams, 2004; Bento et al., 2009; Williams et al., 2015; Douenne, 2020*).
- supported by 3,354 economists in *The Wall Street Journal (2019)*, "To maximize the fairness and political viability of a rising carbon tax".

How to avoid regressivity of carbon tax?

→ **Tax & Dividend**: redistributing equally the revenues. Makes it:

- progressive (*e.g. West & Williams, 2004; Bento et al., 2009; Williams et al., 2015; Douenne, 2020*).
- supported by 3,354 economists in *The Wall Street Journal (2019)*, "To maximize the fairness and political viability of a rising carbon tax".

*With a design ensuring desirable properties, a policy should be supported.*

**But is it really sufficient?**

Based on a large survey representative of the French population, we show that:

- ① Most people oppose a Tax & Dividend
- ② They hold biased (pessimistic) beliefs about it
  - ▶ e.g. 70% expected to win, only 14% think they would
- ③ These beliefs are partially formed through motivated reasoning
- ④ Rejection is driven by biases: correcting them would suffice to generate large majority approval

# Contributions

- **Political economy of the carbon tax:**

Three key motives for acceptance:

(See review by Carattini et al. (2018) or synthesis by Klenert et al. (2018))

- ▶ self-interest (*Thalmann, 2004*)
- ▶ environmental effectiveness (*Bristow et al 2010; Brannlund & Persson 2012*)
- ▶ progressivity (*Kallbekken & Sælen, 2011; Baranzini & Carattini, 2017*)

→ We are the first to:

- ① Estimate objective net gain from the reform
- ② Acknowledge and quantify biases in perceptions
- ③ Estimate causal effects of motives on acceptance

- **Beliefs formation:**

- ① Add new evidence on link between beliefs and preferences for policies (e.g. *Alesina & Angeletos, 2005; Bénabou & Tirole, 2006; Alesina et al., 2018*)
- ② Bi-directional causality identified through directional motivated reasoning (e.g. *Kunda, 1990; Kahan, 2013; Bénabou & Tirole, 2016; Druckman & McGrath, 2019; Little, 2019*)

## Survey data collection

- 3002 responses collected on-line in February/March 2019
- Representative along: gender, age, education, profession, size of town, region
- Median duration: 19 min, important questions in the first half
- We exclude: 4% of respondents answering in less than 7 min, 9% who fail test of quality
- We flag 273 inconsistent answers, such as too high fuel economy or incomes: they are not correlated with our main variables of interest

► [See the questionnaire](#)

- Description of our Tax & Dividend reform:
  - ▶ Tax on fossil fuels: +50€/tCO<sub>2</sub>
  - ▶ +13% on gas (resp. +15% on domestic fuel) redistributed
  - ▶ +0.11€/L on gasoline (resp. +0.13€/L on diesel)
  - ▶ Revenues from households redistributed lump-sum: 110€/year by adult
  - ▶ Tax incidence: borne at 80% by consumers
  - ▶ Elasticities: -0.4 for transport, -0.2 for housing

- Description of our Tax & Dividend reform:
  - ▶ Tax on fossil fuels: +50€/tCO<sub>2</sub>
  - ▶ +13% on gas (resp. +15% on domestic fuel) redistributed
  - ▶ +0.11€/L on gasoline (resp. +0.13€/L on diesel)
  - ▶ Revenues from households redistributed lump-sum: 110€/year by adult
  - ▶ Tax incidence: borne at 80% by consumers
  - ▶ Elasticities: -0.4 for transport, -0.2 for housing
- Do you think this reform would be effective in reducing pollution and fight climate change?
  - ▶ “scientists agree that a carbon tax would be effective in reducing pollution” randomly displayed or not
- Would you lose, win or be unaffected by the reform?
- Expected loss (or gain) among 6 (or 5) intervals?
- Would you approve this reform?

- Description of our Tax & Dividend reform:
  - ▶ Tax on fossil fuels: +50€/tCO<sub>2</sub>
  - ▶ +13% on gas (resp. +15% on domestic fuel) redistributed
  - ▶ +0.11€/L on gasoline (resp. +0.13€/L on diesel)
  - ▶ Revenues from households redistributed lump-sum: 110€/year by adult
  - ▶ Tax incidence: borne at 80% by consumers
  - ▶ Elasticities: -0.4 for transport, -0.2 for housing
- Do you think this reform would be effective in reducing pollution and fight climate change?
  - ▶ “scientists agree that a carbon tax would be effective in reducing pollution” randomly displayed or not
- Would you lose, win or be unaffected by the reform?
- Expected loss (or gain) among 6 (or 5) intervals?
- Would you approve this reform?
  - ▶ 10% 'Yes': approval
  - ▶ 19% 'PNR' (I don't know, I don't want to answer): acceptance
  - ▶ 70% 'No': disapproval

- Net gains of respondents using an official survey:
  - ▶ *Enquête Logement 2013* (EL): 27,000 HH, on housing
  - ▶ increase in housing expenditures =  $\beta_0 + \beta_f \text{ fuel} + \beta_g \text{ gas} + \beta_s \text{ surface}$  [▶ See regressions](#)
  - ▶ increase in transport energy expenditures computed directly from answers
- Revenues estimating by matching two official surveys:
  - ▶ *Budget de Famille 2011* (BdF): 10,000 HH, good on housing, not on transport
  - ▶ *Enquête Nationale Transports et Déplacements 2008* (ENTD): 20,000 HH, used for transport
- In 83.4% of cases, we predict correctly the winning category on out-of-sample (BdF) data

1 Data

2 Biased Beliefs

3 How attitudes shape beliefs

4 How beliefs determine attitudes

5 Conclusion

## Biased perception of net gain (1/2)

PDF of **objective** vs. **subjective** net gains from Tax & Dividend (in € per year per c.u.).

Figure: Net gain. Mean: **-89/+24**

- Objectively, **70% expected to win**, but only **14% think they would** (64% think lose, 21% PNR);
- 89% underestimate their gain, 53% by more than 110€;
- in relative terms: 60% think they lose more than average (>35% much more), 10-15%: less.

## Biased perception of net gain (2/2)

Objective vs. subjective net gains from Tax & Dividend (in € per year per c.u.):

Figure: Net gain. Mean: - - - -: case of inelastic expenditures.

Assuming that everyone's fossils consumption is totally inelastic:

- 77% underestimate their gain, 37% by more than 110€.
- Median gap: 80€.

**Table:** Determinants of a large bias in subjective gains.

	Large bias (bias > 110)		
	OLS	logit	OLS
Initial tax: PNR (I don't know)			-0.179*** (0.023)
Initial tax: Approves			-0.284*** (0.031)

R <sup>2</sup>	0.061		0.098

\* p<0.1; \*\* p<0.05; \*\*\* p<0.01

→ The more opposed to the tax, the more biased? Or opposite direction of causality?

## Beliefs over environmental effectiveness

17% 'Yes', 66% 'No' and 18% 'PNR'.

## Beliefs over environmental effectiveness

17% 'Yes', 66% 'No' and 18% 'PNR'.

→ Tempting interpretation: people perceive aggregate consumption as inelastic  
(Kallbekken & Sælen, 2011; Carattini et al., 2018)

## Beliefs over environmental effectiveness

17% 'Yes', 66% 'No' and 18% 'PNR'.

→ Tempting interpretation: people perceive aggregate consumption as inelastic  
(*Kallbekken & Sælen, 2011; Carattini et al., 2018*)

Ruled out, because people correctly perceive elasticities. [▶ See subjective elasticities](#)

Yet maybe, insufficient impact of the reform:  $-0.8\%$  of *French* GhG emissions.

## Beliefs over progressivity

Reform would benefit poorer households? 19% 'Yes', 60% 'No', 21% 'PNR'.

**Yet, the tax is progressive:**

Figure: Average gain of Tax & Dividend by income decile as a share of disposable income.

1 Data

2 Biased Beliefs

3 How attitudes shape beliefs

4 How beliefs determine attitudes

5 Conclusion

- Information on the effect of the reform
  - ▶ Feedback: “In five cases over six, a household with your characteristics would [win/lose] through the reform. (The characteristics taken into account are: heating using [energy source] for an accommodation of [surface] m<sup>2</sup>; [distance] km traveled with an average consumption of [fuel economy] L for 100 km.)” (1/2)
  - ▶ Progressivity: “this reform would increase the purchasing power of the poorest households and decrease that of the richest, who consume more energy” (1/3)
  - ▶ or both (to 1/6 of respondents)
- Is the reform beneficial to the poorest? (1/2)
- Would you lose, win or be unaffected by the reform?
- Would you approve this reform?

# Conservatism and pessimism

Two main results: [▶ See table](#)

- 1 Losers update correctly (on average): 86% align with feedback
- 2 Winners do not update enough: only 25% align

[▶ See regressions](#)

Possible interpretations:

- Respondents think our feedback is biased (upwards).
- Respondents give too much value to their (biased) private information.
- Respondents are uncertain and loss averse: they report a lower-than-expected outcome.

# Evidence of motivated reasoning

Table: Asymmetric updating of winning category

		Correct updating ( $U$ )		
Winner, before feedback ( $\dot{G}$ )	<b>0.695***</b> (0.078)	0.685*** (0.080)	0.646*** (0.080)	0.659*** (0.080)

5 Conclusion

## Tax & Targeted Dividend

Same policy as before, except that transfers are now targeted to adults below some income threshold:

- Respondents allocated to different thresholds: bottom 20, 30, 40 and 50%
  - ▶ Randomly between two thresholds if respondent's income is within them
  - ▶ When income close to only one threshold (i.e. percentile  $< 20$  or in  $[50; 70]$ ), allocated to that one
  - ▶ When percentile is  $> 70$ , threshold determined by spouse's income
  - ▶ If no spouse or if both have high incomes, threshold allocated randomly
- Would you lose, win or be unaffected by the reform?
- Would you approve this reform?

**Table:** Characteristic of the targeted reform by target of the payment.

Targeted percentiles ( <i>c</i> )	$\leq 20$	$\leq 30$	$\leq 40$	$\leq 50$
Income threshold (€/month)	780	1140	1430	1670
Payment to recipients (€/year)	550	360	270	220
Proportion of respondents	.356	.152	.163	.329
<i>Expected proportion of respondents</i>	<i>.349</i>	<i>.156</i>	<i>.156</i>	<i>.339</i>

## Acceptance of Tax & Targeted Dividend

\*p<0.1; \*\*p<0.05; \*\*\*p<0.01

→ Marginal effect of Progressivity at the sample mean: +27 p.p.

*Question: do these effects complement or substitute?*

Effects of beliefs on approval (strict definitions):

- Three motives: +97 p.p.
- Self-interest & Progressivity: +64 p.p.
- Self-interest & Effectiveness: +69 p.p.
- Effectiveness & Progressivity: +74 p.p.

*Altruistic motives matter!*

⇒ Correcting all beliefs (accounting for the 30% of objective losers): approval rate would go up to 90%!

1 Data

2 Biased Beliefs

3 How attitudes shape beliefs

4 How beliefs determine attitudes

5 Conclusion

## Key results

- ① French people would largely reject a carbon tax policy with uniform lump-sum transfer
- ② Their perceptions about the properties of the scheme are biased:
  - ▶ they over-estimate the negative impact on their purchasing power;
  - ▶ they do not think it is environmentally effective;
  - ▶ they wrongly perceive it as regressive.
- ③ These biases are formed endogenously from their initial attitude:
  - ▶ people give little weight to new information;
  - ▶ they tend to trust more negative news about the tax than positive ones;
  - ▶ the more they oppose, the more likely such a behavior;
  - ▶ even more true among more educated people.
- ④ Nonetheless: if one could convince them, the scheme would reach majority acceptance.
  - ▶ High causal effect (LATE) of beliefs about self-interest and environmental effectiveness on acceptance;
  - ▶ Considering ATE: high complementarity between motives, especially altruistic ones.

Two critical challenges for the future:

- In the short run:
  - ▶ Carbon taxation unlikely to be extended
  - ▶ Need for alternative policy instruments, trading-off cost-effectiveness for public support

→ Which ones? See our companion paper [▶ Main results](#)

- In the long run:
  - ▶ Need to restore trust in government and institutions
  - ▶ Only then can we have a carbon tax

→ How to? More transparency, more redistribution, deliberation?

More to learn from the Yellow Vests movement! [▶ Who are the Yellow Vests?](#)

## Willingness to pay

Our results are also indicative of a WTP for an effective policy:

**Figure:** Acceptance rate by subjective gain, informing on the willingness to pay for climate mitigation.

Results suggest a WTP of 60€ per c.u. (i.e. about 100€ per household) in the typical range of the literature (Jenkins, 2014; Streimikiene et al., 2019).

Observations	1,265	1,265

## Bias persistence over progressivity

It seems we do not convince people at all here ! How come?

⇒ Evidences of psychological reactance from biased people (boomerang effect, see Hovland 1953):

**Table:** Effect of information on perceived progressivity

	Progressivity: not No ( $P$ )		
	(1)	(2)	(3)
Constant	0.419*** (0.022)	0.435*** (0.033)	0.386** (0.186)
Information on progressivity ( $Z_P$ )	-0.021 (0.027)	0.050 (0.040)	0.014 (0.239)
Large bias ( $ \hat{\gamma} - g  > 110$ )		-0.028 (0.045)	-0.019 (0.045)
Interaction $Z_P \times ( \hat{\gamma} - g  > 110)$		-0.130** (0.055)	-0.126** (0.055)
Controls: Socio-demo, politics			✓
Observations	1,444	1,444	1,444
R <sup>2</sup>	0.0004	0.018	0.100

\*  $p < 0.1$ ; \*\*  $p < 0.05$ ; \*\*\*  $p < 0.01$

## Subjective elasticities

→ Tempting interpretation: people perceive aggregate consumption as inelastic (Kallbekken & Sælen, 2011; Carattini et al, 2018)

**Table:** Effect of subjective elasticities on perceived environmental effectiveness

	Environmental effectiveness: not 'No'			
	(1)	(2)	(3)	(4)
Price elasticity: Housing	-0.062* (0.032)		-0.055* (0.032)	
Price elasticity: Transports		-0.056* (0.030)		-0.060** (0.030)
Controls: Socio-demographics, energy			✓	✓
Observations	1,501	1,501	1,501	1,501
R <sup>2</sup>	0.003	0.002	0.089	0.090

Note:

\*  $p < 0.1$ ; \*\*  $p < 0.05$ ; \*\*\*  $p < 0.01$

Effect too small to explain the beliefs.

► Go back

## Asymmetric beliefs' revision

► Go back

**Table:** Share of respondents with new beliefs aligned with feedback

	<i>Aligned with feedback</i>	
	winners (75.8%)	losers (24.2%)
Initial belief: win (14.0%)	78.8% [73.2% ; 83.4%]	81.5% [65.0% ; 91.3%]
Initial belief: unaffected (21.7%)	21.6% [17.6% ; 26.2%]	44.9% [33.5% ; 56.8%]
Initial belief: lose (64.3%)	12.2% [10.3% ; 14.5%]	93.9% [90.9% ; 96.0%]
All (100%)	25.1% [23.0% ; 27.3%]	85.7% [82.2% ; 88.7%]

NOTE: The 95% confidence intervals for binomial probabilities is given in brackets.
